

**AMENDMENTS TO THE SPECIFICATION:**

Please replace paragraph [23] as follows:

**[0023]** In all illustrated embodiments the interlocking limb 10, 10' is provided at its side facing the ~~roof-body~~ frame 3 with an inward bent locking step 11, which is in releasable interlocking engagement with the inner edge 12 of a frame covering 13 in the embodiment according to Figure 2 and with the inner edge 12' of the actual body frame 3 in the embodiments according to Figures 3 and 4. In order to facilitate the action of interlocking with the inner edge 12, 12', the interlocking limb 10, 10' has an oblique face 14 which slides on the inner edge 12, 12' when interlocking takes place, with simultaneous elastic bending by forming of the interlocking limb 10, 10', until the locking step 11 is interlocked below the inner edge 12, 12', with elastic return of the interlocking limb 10, 10'. The interlocked position of the parts is represented in Figures 2 to 4.
